

Task 3: IT Support Interview Preparation

❖ What is IT support, and what does a typical day involve?

Sample Answer:

IT support involves assisting users with technical issues related to hardware, software, networks, and systems. A typical day includes troubleshooting problems like login issues, network connectivity errors, printer faults, and software installation. It also involves monitoring systems, responding to helpdesk tickets, and ensuring minimal downtime for users.

❖ How would you troubleshoot a computer that won't turn on?

Sample Answer:

First, I would check the power source, including the power cable, socket, and UPS. Then I would verify internal hardware connections such as RAM and power supply. If the issue persists, I would test with another power cable or monitor and isolate whether it is a hardware or power failure before escalating if necessary.

❖ What steps would you take if a user cannot connect to the internet?

Sample Answer:

I would first check physical connections like Ethernet cables or Wi-Fi status. Then I would verify IP configuration using network commands. I would restart the router or network adapter, check DNS settings, and confirm whether other devices are affected to determine if the issue is local or network-wide.

❖ **How do you handle multiple support requests at the same time?**

Sample Answer:

I prioritize issues based on urgency and business impact. Critical issues affecting multiple users or systems are handled first, followed by individual user problems. I also use ticketing systems to track progress and ensure timely updates and resolution of all requests.

❖ **What is Active Directory and why is it important?**

Sample Answer:

Active Directory is a directory service used to manage users, computers, and permissions within a network. It is important because it centralizes authentication and authorization, making it easier to control access, enforce policies, and improve security within an organization.

❖ **How do you ensure data security in an organization?**

Sample Answer:

I ensure data security by implementing strong password policies, enabling multi-factor authentication, applying regular software updates, using antivirus protection, and enforcing access control based on user roles. Regular backups and security awareness training also help reduce risks.

❖ **What would you do if a printer is not working?**

Sample Answer:

I would first check if the printer is powered on and connected properly. Then I would verify if there are any paper jams or low ink issues. Next, I would check the print queue and reinstall or update printer drivers if necessary. If needed, I would restart the print spooler service.

❖ **Explain the difference between hardware and software.**

Sample Answer:

Hardware refers to the physical components of a computer system such as the CPU, RAM, and hard drive. Software refers to programs and applications that run on the hardware, such as operating systems and productivity tools.

❖ **How do you handle a frustrated user?**

Sample Answer:

I remain calm, listen carefully, and allow the user to explain the issue without interruption. I reassure them that I will assist and then clearly explain the steps I will take to resolve the problem. Good communication and patience are key to resolving such situations effectively.

❖ **Why do you want to work in IT support?**

Sample Answer:

I am passionate about technology and problem-solving. IT support allows me to help users resolve technical issues while improving system performance and reliability. It also gives me the opportunity to continuously learn and grow in the IT field, especially in networking, systems, and cybersecurity.
